

Welcome to the Whatami project page.

Whatami is a portable shell script to determine what platform/arch/os/distro a system is.

Its a bourne (sh) script to attempt to be portable everywhere. It can be installed as a dpkg, an rpm or the naked script itself.

For svn access, checkout with

svn co <https://svn.mcs.anl.gov/repos/whatami/trunk>

svn co [https://svn.mcs.anl.gov/repos/whatami/tag/\\$TAG](https://svn.mcs.anl.gov/repos/whatami/tag/$TAG)
